

# CSS HOMEWORK 08

## RESPONSIVE DESIGN:

### Prompt:

You will need to download the "index.html" and "style.css" files, they will contain the starter template code necessary to complete the assignment. Make sure to use a mobile first approach when solving the questions.

### Requirements:

1. **Step 1:**
  - You first need to adjust the ".card" class to be mobile-friendly. Currently, it takes up 800px of width. On smaller screens, the card takes up 80% of the width, and on desktop and larger the card takes up 800px. (use a breakpoint of 1024px for this media query).
2. **Step 2:**
  - For the section of "question-one" on mobile devices make the items form in a column, but when the device is a tablet or higher (use 768px) make the items form a row.
3. **Step 3:**
  - For the section of "question-two" on smaller screens keep the background color white, but when the screen is larger (1024px breakpoint), change the background color to anything else other than white.
4. **Step 4:**
  - For the section of "question-three" center all the items in this section, but only for mobile devices, so when the screen width is of tablet or higher (768px) we do not want the items to be centered.
5. **Step 5:**
  - On smaller devices hide section "question-four". When the device is of tablet or larger (768px) we want to see the section.
